Evidences for DM

- Rotation Curves of Galaxies
- Gravitational Lensing
- Large Scale Structure
- CMB anisotropies
- ……

These evidences all come from gravitational interaction
CDM: velocity dispersion is negligible for structure formation, a popular candidate, WIMP,
M ~ 100 GeV, $\langle \sigma v \rangle_{ann} \sim 3 \times 10^{-26} cm^3/s$

DM-Induced Gamma Rays

$$\frac{d^2\Phi_\gamma}{dE_\gamma d\Omega} = \sum_i \frac{dN_\gamma^i}{dE_\gamma} \frac{\langle\sigma v\rangle_i}{8\pi M_{DM}^2} \int_{l.o.s} \rho^2\left(r(r',\theta)\right) dr'$$

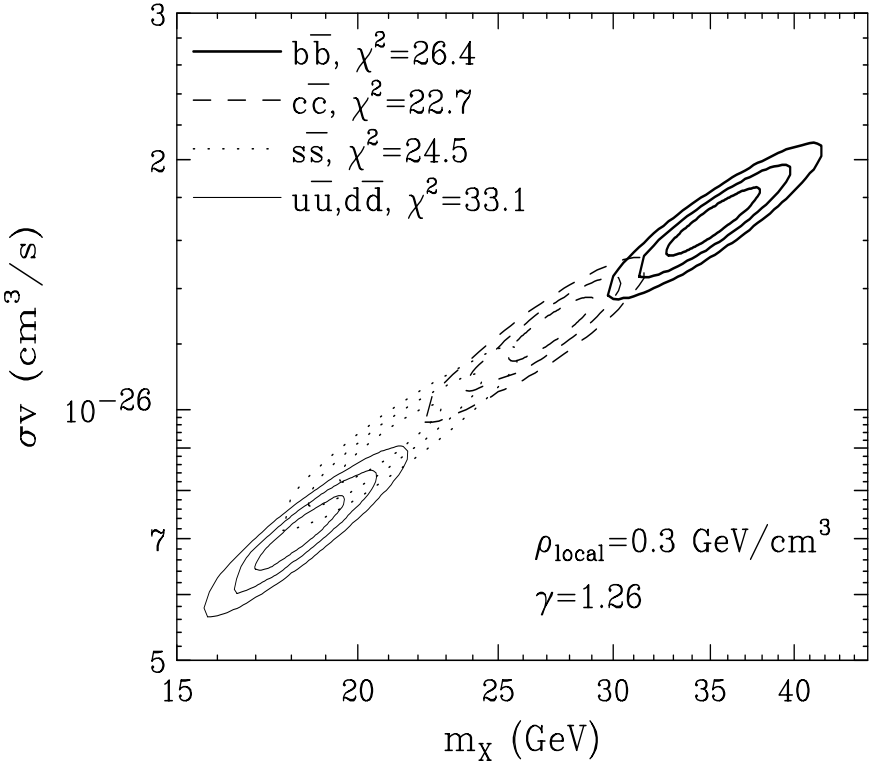
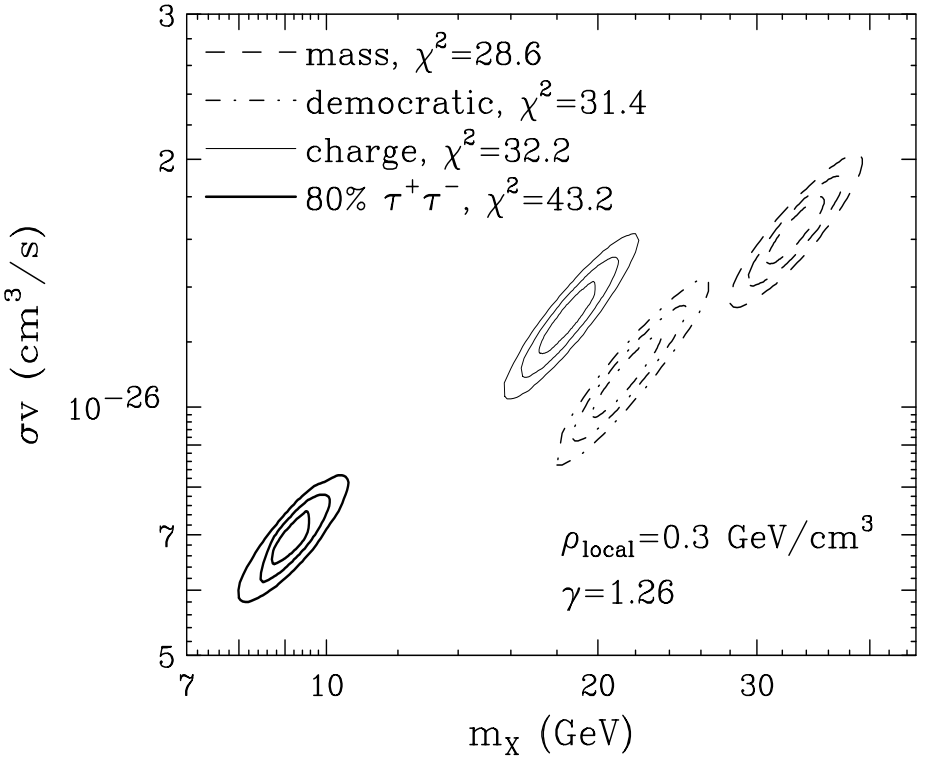
Channels

Daylan+2014





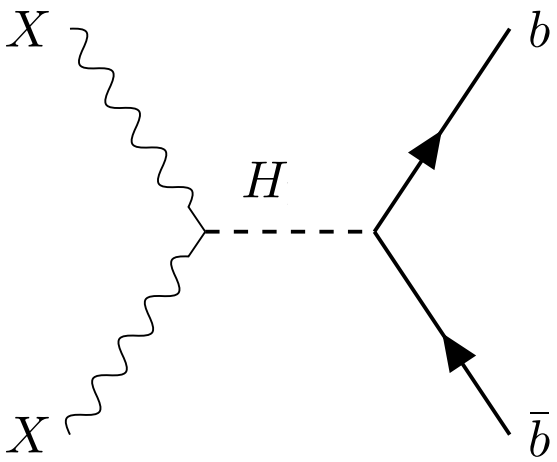
- heavy quark channel are favored,
- Naturally higgs-like couplings?

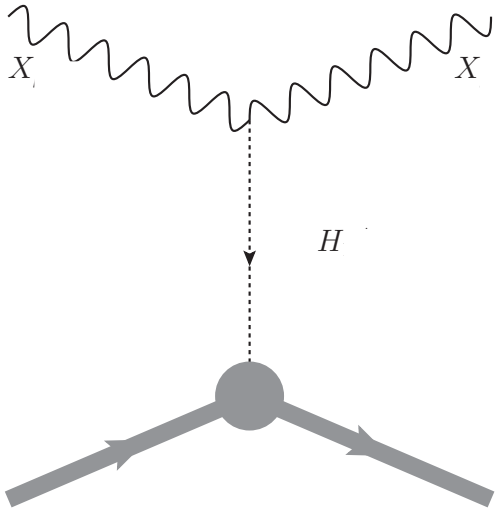
Higgs Portal DM

$$\Delta\mathcal{L}_S = -\frac{1}{2}m_S^2 S^2 - \frac{1}{4}\lambda_S S^4 - \frac{1}{4}\lambda_{hSS} H^\dagger H S^2 \ ,$$

$$\Delta\mathcal{L}_V = \frac{1}{2}m_V^2 V_\mu V^\mu + \frac{1}{4}\lambda_V (V_\mu V^\mu)^2 + \frac{1}{4}\lambda_{hVV} H^\dagger H V_\mu V^\mu,$$

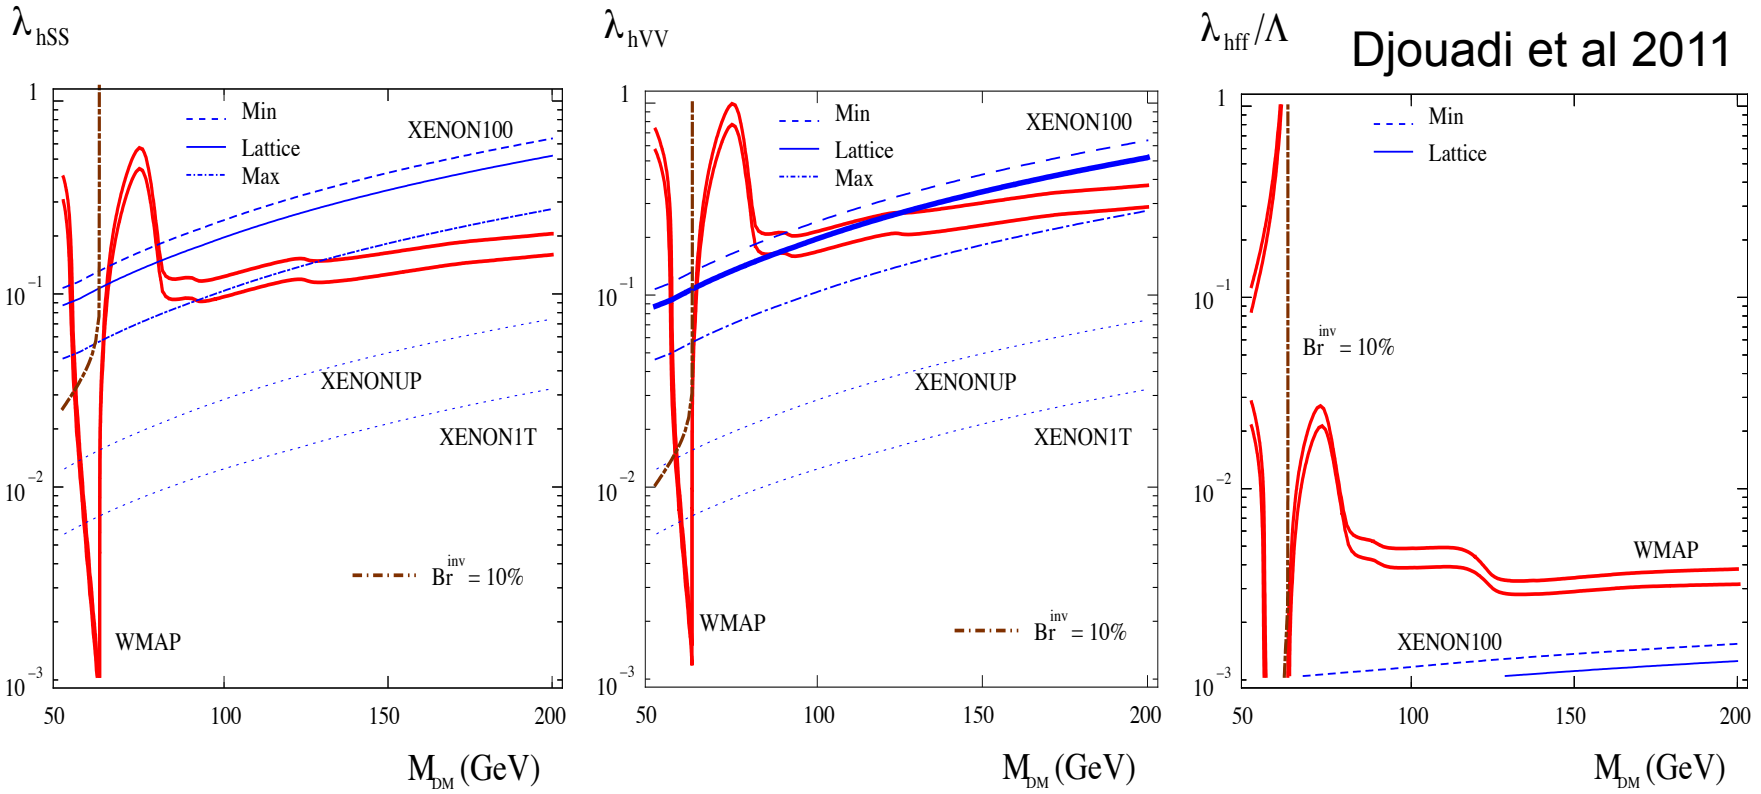
$$\Delta\mathcal{L}_f = -\frac{1}{2}m_f \bar{\chi}\chi - \frac{1}{4}\frac{\lambda_{hff}}{\Lambda} H^\dagger H \bar{\chi}\chi.$$





Direct Detection Bounds

Highly constrained, GeV favored region excluded.



$U(1)_X$ Vector DM

P.Ko, W-I.Park, YT,1404.5257(JCAP)

- U(1) dark gauge symmetry,

$$\mathcal{L} = -\frac{1}{4}X_{\mu\nu}X^{\mu\nu} + (D_\mu\Phi)^\dagger(D^\mu\Phi) - \lambda_\Phi\left(\Phi^\dagger\Phi - \frac{v_\Phi^2}{2}\right)^2$$
$$- \lambda_{H\Phi}\left(H^\dagger H - \frac{v_H^2}{2}\right)\left(\Phi^\dagger\Phi - \frac{v_\Phi^2}{2}\right) - \lambda_H\left(H^\dagger H - \frac{v_H^2}{2}\right)^2 + \mathcal{L}_{\rm SM}.$$

- dark Higgs field

$$D_\mu\Phi = (\partial_\mu + ig_X Q_\Phi X_\mu)\Phi,$$

- symmetry breaking

$$\Phi(x) = \frac{1}{\sqrt{2}}\left(v_\Phi + \varphi(x)\right),$$

Particle spectrum

- Massive gauge boson X is the Dark Matter
- Mixed two scalars

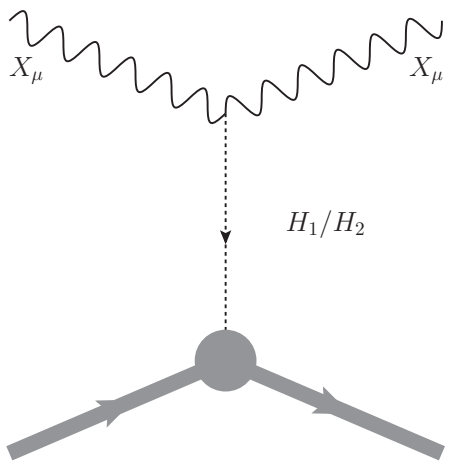
$$\begin{pmatrix} h \\ \varphi \end{pmatrix} = \begin{pmatrix} c_\alpha & s_\alpha \\ -s_\alpha & c_\alpha \end{pmatrix} \begin{pmatrix} H_1 \\ H_2 \end{pmatrix} \equiv O \begin{pmatrix} H_1 \\ H_2 \end{pmatrix}$$

- mixing angle $s_\alpha(c_\alpha) \equiv \sin\alpha(\cos\alpha)$

$$\mathcal{M} \equiv \begin{pmatrix} 2\lambda_H v_H^2 & \lambda_{H\Phi} v_H v_\Phi \\ \lambda_{H\Phi} v_H v_\Phi & 2\lambda_\Phi v_\Phi^2 \end{pmatrix} = \begin{pmatrix} M_{H_1}^2 c_\alpha^2 + M_{H_2}^2 s_\alpha^2 & \left(M_{H_2}^2 - M_{H_1}^2\right) s_\alpha c_\alpha \\ \left(M_{H_2}^2 - M_{H_1}^2\right) s_\alpha c_\alpha & M_{H_1}^2 s_\alpha^2 + M_{H_2}^2 c_\alpha^2 \end{pmatrix}.$$

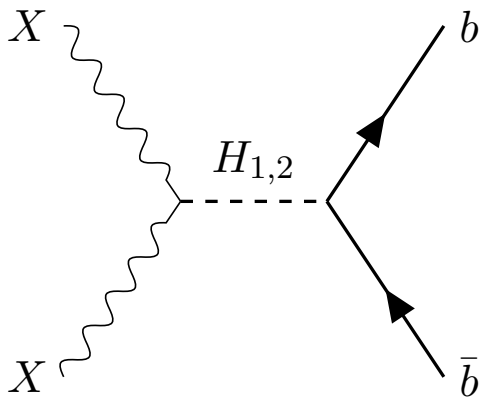
$$\tan 2\alpha = \frac{2\mathcal{M}_{12}}{\mathcal{M}_{22} - \mathcal{M}_{11}}, \text{ or } \sin 2\alpha = \frac{2\lambda_{H\Phi} v_H v_\Phi}{M_{H_2}^2 - M_{H_1}^2}.$$

Direct Detection

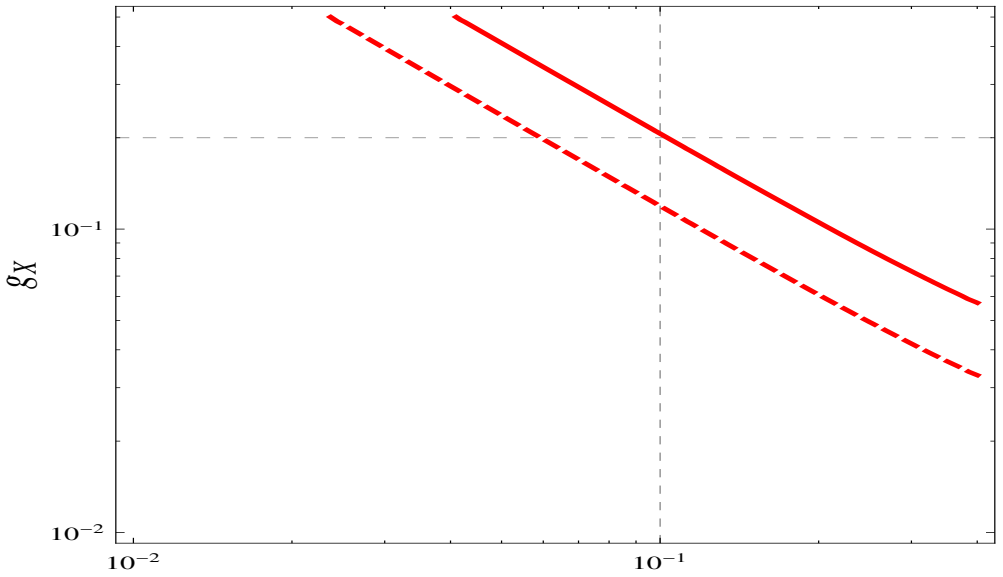


$$\sigma_p^{\rm SI} = \frac{4\mu_V^2}{\pi}\left(\frac{g_X s_\alpha c_\alpha m_p}{2v_H}\right)^2\left(\frac{1}{m_{H_1}^2}-\frac{1}{m_{H_2}^2}\right)^2 f_p^2,$$

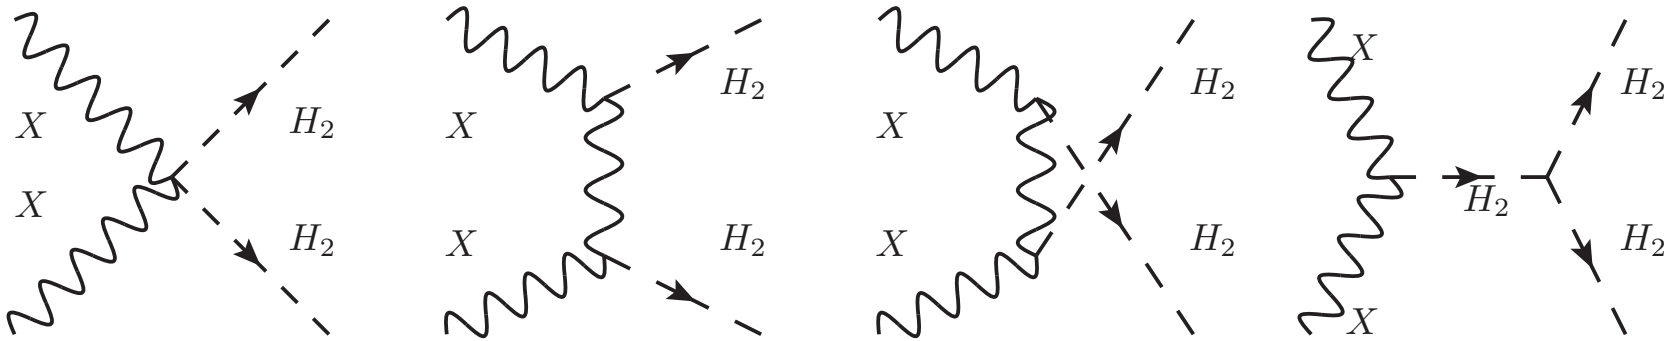
$$\simeq 2.2\times 10^{-45}{\rm cm}^2\left(\frac{g_X s_\alpha c_\alpha}{10^{-2}}\right)^2\left(\frac{75\,{\rm GeV}}{m_{H_2}}\right)^4\left(1-\frac{m_{H_2}^2}{m_{H_1}^2}\right)^2$$



$$m_X = 80GeV, m_{H_2} = 75GeV$$

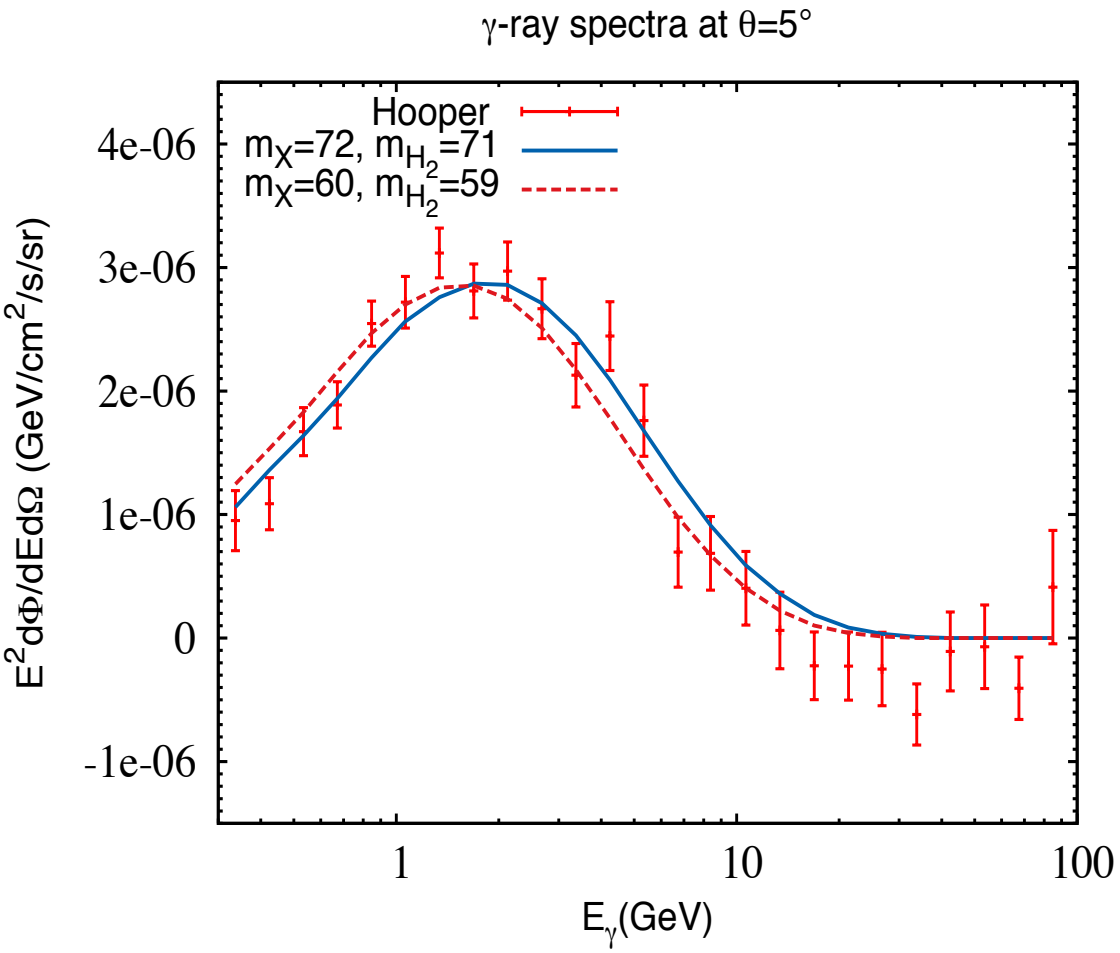


Annihilation



- These are the dominant annihilating processes,
- The on-shell final particles decay into standard model fermions,
- mostly bb for 35GeV dark Higgs

Gamma-Ray spectrum



P.Ko, W-I.Park, YT,1404.5257(JCAP)

Extensions: Hidden sector DM

- hidden sector for DM with gauge symmetry
- residual symmetry, dark Higgs, new massive gauge boson(s),
- new particles decay into SM fermions through Higgs portal, kinetic mixing
- Example: Z_3

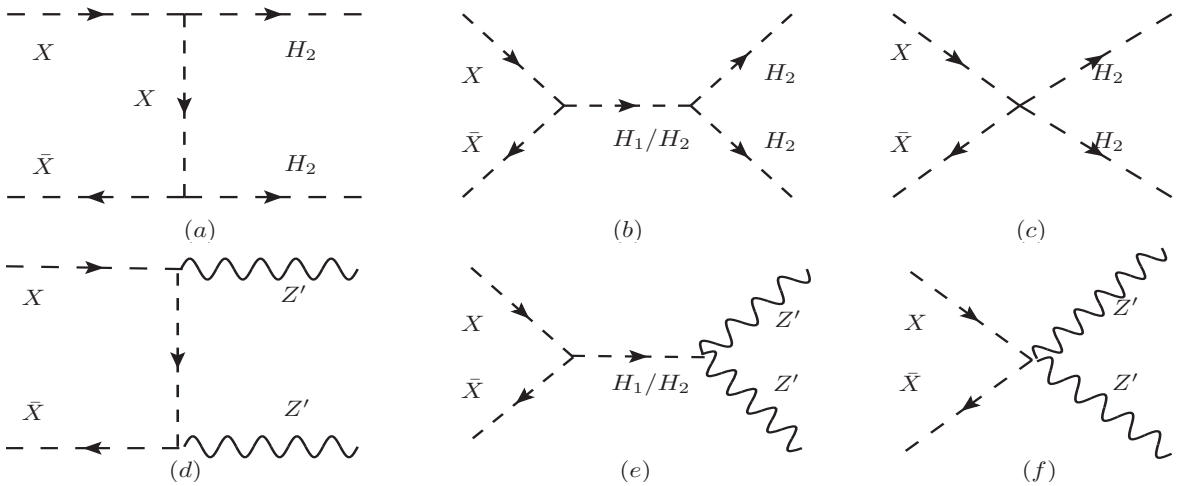
P. Ko, YT, 1407.5492(JCAP)

$$\mathcal{L} = \mathcal{L}_{\rm SM} - \frac{1}{4}\tilde{X}_{\mu\nu}\tilde{X}^{\mu\nu} - \frac{1}{2}\sin\epsilon\tilde{X}_{\mu\nu}\tilde{B}^{\mu\nu} + D_\mu\phi_X^\dagger D^\mu\phi_X + D_\mu X^\dagger D^\mu X - V,$$

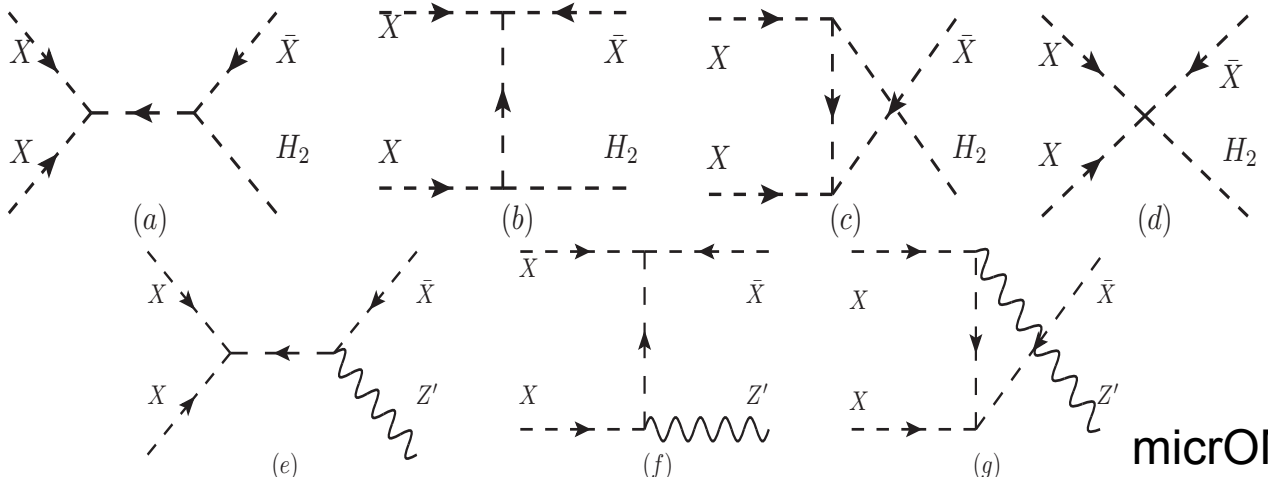
$$V = -\mu_H^2 H^\dagger H + \lambda_H\left(H^\dagger H\right)^2 - \mu_\phi^2\phi_X^\dagger\phi_X + \lambda_\phi\left(\phi_X^\dagger\phi_X\right)^2 + \mu_X^2 X^\dagger X + \lambda_X\left(X^\dagger X\right)^2$$
$$+ \lambda_{\phi H}\phi_X^\dagger\phi_X H^\dagger H + \lambda_{\phi X}X^\dagger X\phi_X^\dagger\phi_X + \lambda_{HX}X^\dagger X H^\dagger H + \left(\lambda_3 X^3\phi_X^\dagger + H.c.\right),$$

Annihilation Channels

- Standard

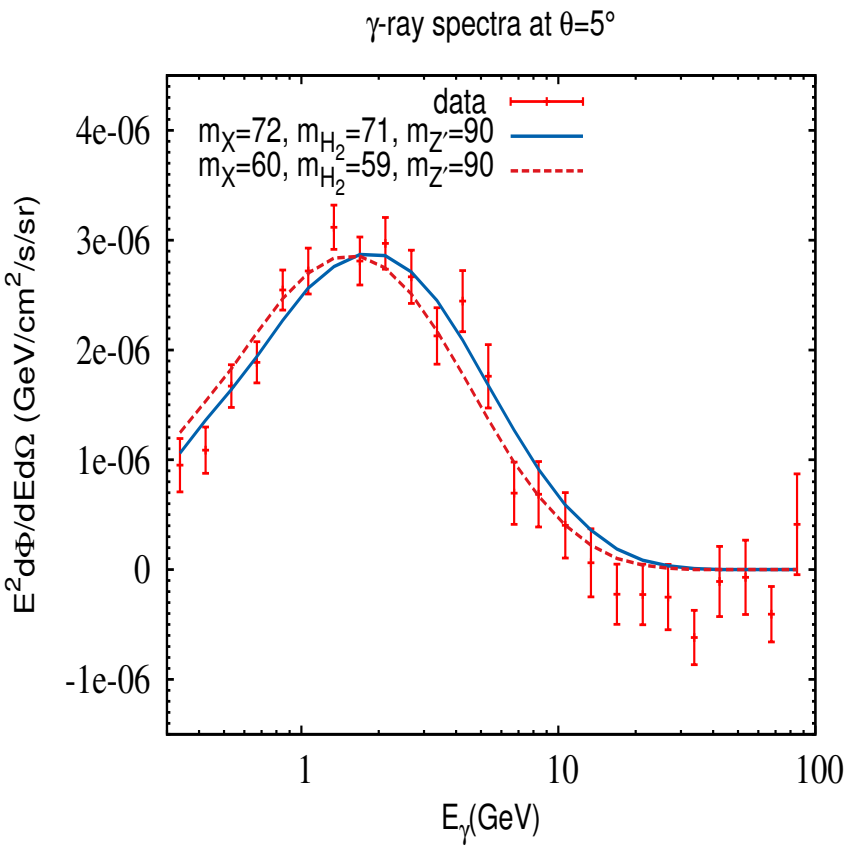


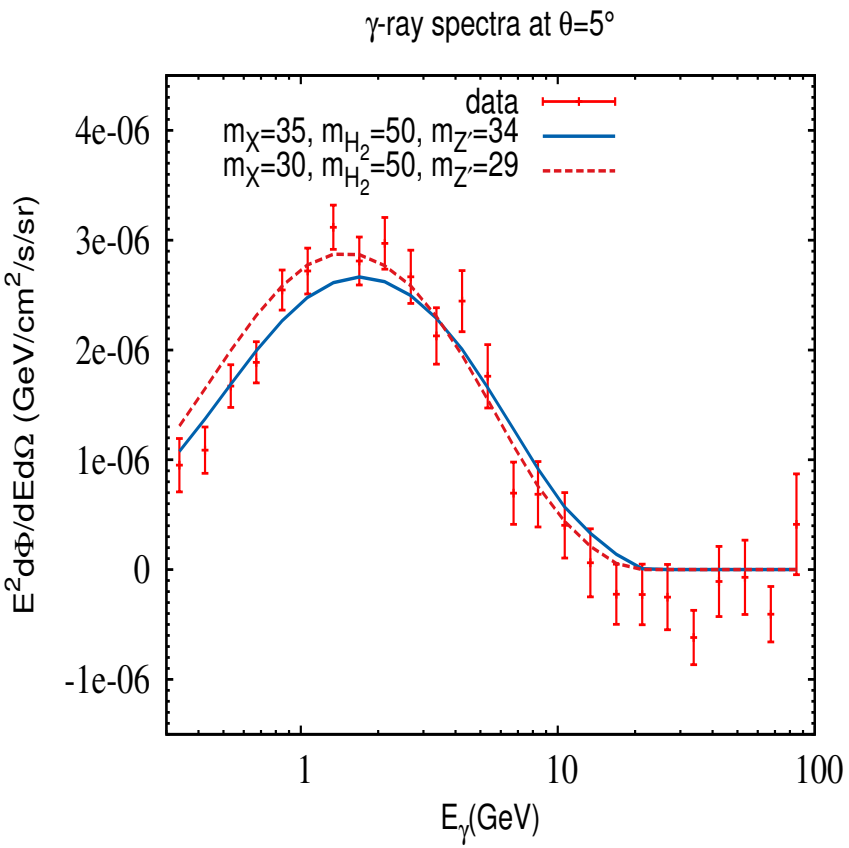
- Semi-Annihilation



micrOMEGAs-3

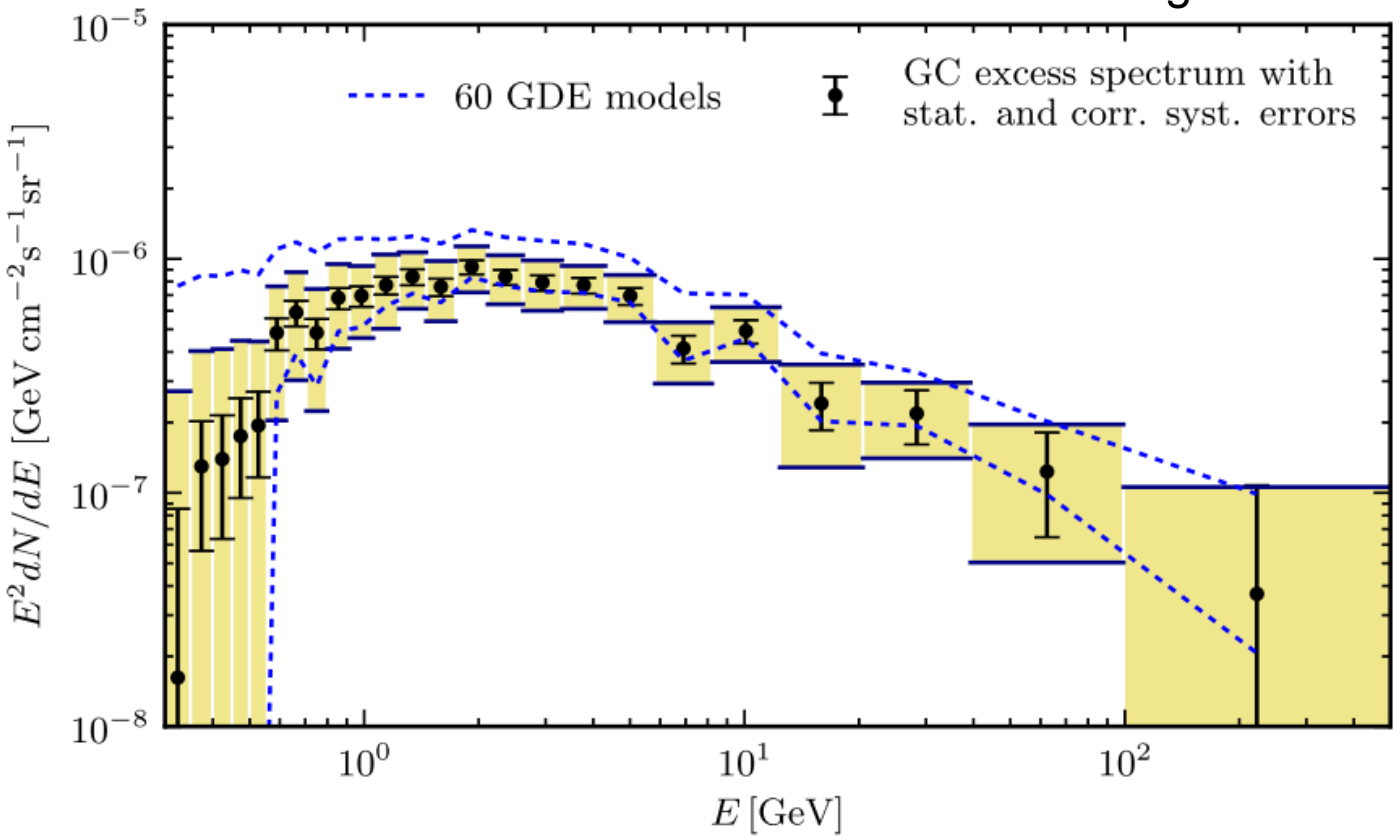
γ-ray spectra





Uncertainties

Weniger+2014



Empirical model uncertainties (yellow) and theoretical model uncertainties (blue lines) are significantly larger than the statistical error over the entire energy range.

Summary

- We have briefly introduced the GeV gamma-ray excess from galactic center.
- The very simple Higgs portal DM models are *not* able to explain such an excess,
- Simple DM models with gauge symmetries are fully capable of providing the needed signal.
- We have specifically discussed a vector dark matter model, and a scalar dark matter with Z_3 symmetry.

THANK YOU.
